

The Architectural Blueprint of IBM Maximo

A structural breakdown of the Maximo ecosystem, from **external integrations** to the **relational database core**.

IBM
maximo

Maximo Manage operates as the core EAM engine within the broader Application Suite.

IBM Maximo Application Suite (MAS)

- **Scope:** Holistic Enterprise Ecosystem
- **Primary Function:** Unifies AI, IoT, Analytics, and EAM
- **Deployment:** Red Hat OpenShift / Hybrid Cloud

Maximo Manage

- **Scope:** Core Application Component
- **Primary Function:** Traditional Enterprise Asset Management (EAM)
- **Deployment:** Operates as an application within MAS

Core enterprise asset management functions are organized into distinct application modules.

IBM Maximo is a modular Enterprise Asset Management platform. Users only interact with the modules necessary for their specific role and security profile.

System Configuration

Database Configuration

Maximo scales through a classic N-Tier architecture model.

A relational database foundation underpins all Maximo objects and configurations.

The database stores both application data (assets, work orders) and the system metadata (screen designs, configurations) in a unified relational model.

System security relies on a defense-in-depth model across three distinct layers.

Security is not a single gateway. A user must pass through authentication to enter the system, authorization to view a module, and data-level security to view specific assets.

REST APIs provide a standardized gateway for mobile and external application access.

The integration framework connects Maximo to enterprise systems and Digital Twin platforms

Maximo supports extensive integration, allowing physical asset records to synchronize in real-time with financial ledgers and dynamic Digital Twin environments.

The Complete Maximo Architecture Ecosystem

By layering modular applications over a relational database, securing it via defense-in-depth, and exposing it through robust APIs, Maximo serves as a scalable, connected platform for enterprise asset management.
