

Enterprise Asset Management in Maximo

A visual reference guide to inventory taxonomy, structural architecture, and execution workflows at OIKN.

Defining the Maximo Inventory Taxonomy

Item

- Consumed during maintenance work.
- Tracked as spare parts or IT inventory.
- Physically stored in a Storeroom.

Tool

- Supports maintenance work but is NOT consumed.
- Usage in maintenance is not charged.
- Can be physically stored in a Storeroom.

Service

- External capability purchased from outside parties.
- Catalogued for frequent or recurring purchases.

Items and Tools share the physical trait of “Storeroom Storage,” while Services sit completely outside the physical warehouse domain.

The Item Master Hub

Mapping the Physical to the Financial

Enterprise Level (Item Set)

Items are created at the enterprise level so multiple organizations can share the same master list.

COMP1-ENG-STORE

(Engineering Storeroom)

Contains all spare-parts and tools for the engineering department.

General Ledger (GL)
Control Account

Shrinkage
Account

COMP1-IT-STORE

(IT Storeroom)

Contains all purchased IT materials.

General Ledger (GL)
Control Account

Shrinkage
Account

Every physical movement inherently triggers a financial record.

Securing Data Integrity During Audits

The Storeroom Lock/Unlock Mechanism

To perform an accurate inventory audit (Stock Opname), stock movement must be temporarily halted.

Key Takeaways

- Activating the lock prevents any standard inventory transactions (receiving or issuing items) against that specific storeroom.
- Managed by Accounting personnel to guarantee safe auditing conditions without system interference.

Access Control: Executing a Storeroom Lock

Performed by Accounting during Stock Opnames to prevent inventory transactions.

Registration Blueprint: Core Fields

Recipe Card	
Item Code 	☐ Rotating
System Auto-filled	
Description 	☒ Inspect on Receipt
Free text	
Item Template 281.Inventory	☐ Condition Enabled Requires at least 1 Condition Code at rate 100
Commodity Group / Code 	
Classification	
Order Unit / Issue Unit UNT	

Rotating (Tracked Assets)

- **Concept:** Treated as an individual, unique asset.

- **Record:** Each physical unit gets its own unique **Asset Record** in the Asset Application.

- **Use Case:** When you must track individual movement and maintenance history.

Non-Rotating (Consumables)

- **Concept:** Tracked entirely by **aggregate quantity** and **balance**.

- **Record:** No individual asset records exist in the system.

- **Use Case:** When tracking the exact physical movement of individual pieces is unnecessary.

Tracking Valuation Through Asset Condition

Applied exclusively to Rotating items, enabling conditions forces users to define the physical state of an asset, which directly alters its assigned cost when utilized.

WARNING: The Rotating and Condition Enabled states can only be defined **BEFORE** the item becomes active in the system.

Defining Scale with Units of Measure

Balances are recorded based on the Issue Unit. When receiving items in a different unit, Maximo utilizes a **Conversion Factor** automatically during receipt or transfer based on predefined master data.

Order Unit
(e.g., PLT)

Conversion Factor: 10

Issue Unit
(e.g., EACH)

Analyzing Spend via Commodity Classifications

SYSTEM RULE: A specific commodity group/code combination must be strictly flagged for either Service types OR Item/Tool types. They cannot mix. This restriction enables precise vendor utilization and spend analysis.

The Anatomy of a Maximo Item Master

Synthesis Statement: Creating an item in Maximo is not simply typing a name; it is the act of assembling these distinct administrative components to forge a complete financial and operational digital twin.

The Item Master Lifecycle
