

Architecting Automated Work Management

From Manual Planning to Automated Execution

The Agile Work Management module eliminates redundant planning by separating the 'How', 'When', and 'Where' of maintenance into distinct, reusable building blocks. Once configured, these components act as an automated engine, generating standardized Work Orders on demand.

The Blueprint of a Task: Anatomy of a Job Plan

The Validation Protocol: Job Plan Approval Routing

Memos are required during Revision/Cancellation actions to maintain a strict audit trail.

The Trigger Mechanism: Preventive Maintenance (PM)

A Preventive Maintenance record is the scheduling shell. It links an approved Job Plan to a specific work asset and defines exactly when the work should occur and what status the resulting Work Order will hold.

Trigger Configurations: Time vs. Meter Based PMs

	Time-Based	Meter-Based
Trigger Mechanism	Elapsed calendar time.	Continuous asset usage data.
Frequency Units	Configured in Days, Months, Weeks, or Years.	Configured by selecting specific predefined Asset Meters.
Next Due Date Calculation	Calculated automatically from the Last Completion/Start Date.	Requires manual entry of a new Meter Reading via the Assets module to calculate the next threshold.
Use Case	Calendar inspections (e.g., Annual Fire Extinguisher check).	Usage wear-and-tear (e.g., Engine maintenance every 5,000 running hours).

Time Based Frequency

Frequency:

0

Frequency Units:

DAYS

The Forecasting Engine: Predicting Future Work

Tiered Maintenance: Multiple Job Plan Sequences

A single PM record can cycle through different Job Plans based on scheduled intervals, allowing for alternating minor and major maintenance cycles without creating redundant PM records.

Scaling Execution: Grouping Work with Routes

Routes simplify hierarchies. Instead of creating 50 PMs for 50 fire extinguishers, Planners create one Route listing all 50 as "Stops." One PM generates work for the entire Route.

Route Stop Inherit Change Status?

- Checking this box allows all child work orders generated from this route to update simultaneously when the parent WO status changes.

The Automation Engine

Automatically routed to the right personnel with accurate costs, required tools, and exact locations.
