

The Connected Facility Dashboard

A conceptual map of the Autodesk Tandem ecosystem and facility data lifecycle.

The key concept behind Autodesk Tandem

Autodesk Tandem transforms disparate architectural, engineering, and construction data into an operational digital twin. It is a cloud-based platform designed to organize and map facility data, creating a single, interactive source of truth for owners and operators.

The continuous lifecycle of facility data.

Comparing the three pillars of the Tandem data journey.

	Specify	Capture	Manage
Focus Stage	Upfront planning and requirements gathering.	Active inventory and asset connection.	Ongoing operations and utilization.
Primary Action	Defining what data is needed before handover.	Mapping physical building assets to digital records.	Interacting with dashboards to monitor performance.
Core Value	Standardization.	Accuracy.	Insight.

The architectural hierarchy of the Tandem platform.

Establishing the foundation with the Facility Overview.

- **Create Facility:** The first step in the workflow, establishing the baseline container for all project data.
- **Facility Overview:** A centralized landing environment displaying the foundational blueprint and raw asset parameters before live data routing begins.

Integrating the real world through Tandem Connect.

Connection Overview

The interface where administrators map raw data feeds to specific physical assets within the facility model.

Tandem Connect

The integration engine designed to bind external systems, operational workflows, and the digital twin into a single cohesive network.

Centralized control through Team Management.

Autodesk Tandem enables fine-grained access control. The Team Management architecture ensures that while the Facility remains a single source of truth, administrators can tailor permissions, access, and visibility for every stakeholder in the lifecycle.

The command center for facility operations.

Filtering the noise with tailored Views.

Raw Facility Data

Isolated View

Views: While Dashboards summarize data, Views provide spatial context. Users can create, save, and share customized 3D visual filters that isolate specific asset categories, isolating precisely what is needed for a given task.

The complete Tandem ecosystem synthesis.

Autodesk Tandem is not a collection of isolated features. It is a unified engine that takes specified requirements and captured physical realities, routes them through a secure connection framework, and outputs a living, actionable digital twin.

Structuring the deployment and ecosystem.

Card 1

Planning & Setup

System Requirements:

Cloud-based parameters for optimal performance.

Hardware Solutions:

Recommended setups for data capture and operational management.

Card 2

Implementation

Release Notes:

Tracking the continuous evolution of platform features.

Get Help:

Direct channels to technical support and the documentation library.

Card 3

Future-Proofing

Tandem Roadmap:

Visibility into upcoming capabilities.

Tandem Betas:

Early access to next-generation twin technologies.

Accessing the Autodesk Tandem platform.

Begin the Build. Access Autodesk Tandem Free to initiate your first digital facility layer.

Explore the Capability. View the Tandem Demo to see a fully connected digital twin in action.

Expand your Knowledge. Visit the Resource Center to review case studies, subscribe to updates, and dive deeper into the facility data lifecycle.
