

Master the Agile EMS: Resource & Asset Architecture

A visual guide to structuring People, Labor, Locations, and Assets in your Enterprise Management System.

The Digital Twin: How the Pieces Connect

The Human Layer

The Physical Layer

Defining the Human Element: Person vs. User vs. Labor

Person

The Foundation

- Stores foundational identity
- Name, Address, Contact Info
- Holds Delegation configurations

User

The Access Layer

- Grants system entry
- Authentication & Passwords
- Security Profiles & Permissions

Labor

The Workforce Layer

- Tracks physical work capability
- Skills & Qualifications
- Craft associations & Work Site

Crucial Rule: You cannot create a Labor or User record without first creating a Person record.

Managing Individuals & Continuity

1 → **Change Status**

Status: ACTIVE

* New Status:

INACTIVE

2 → **Workflow and Work Order**

Workflow Delegate: ACC02 >>

Delegate From: 5/3/16

Delegate To: 5/10/16

Key Takeaway: To ensure no assignments are lost when a person is absent, temporary delegates must be set directly on their foundational Person record. Upcoming assignments will automatically route to the delegate.

Person Groups: Automating Workflow Routing

Person	Name	Sequence
ACC01	Accounting01	1
ACC02	Accounting02	2
ACC03	Accounting03	3

Sequence values determine priority routing order.

Structuring Capability: Crafts & Skill Levels

Efficiency Rule: You only need one Craft record per trade. Use Skill Levels to differentiate expertise ranks (1 is highest, 5 is lowest) and manage standard rates without duplicating records.

Handling Overtime & Connecting Labor

Premium Pay Codes

Premium Pay Code	Description	Default Rate Type	Default Rate
OT1	Greater than 8 hours per shift	MULTIPLIER	1.50

Associated Labor Tab

Labor	Name	Skill Level
TEC01	Technician01	JUNIOR

Premium Pay dictates financial rules, while Associated Labor maps your real-world workforce to their qualified system roles.

Infrastructure Foundation: Assets vs. Locations

The Stage

- The static environment.
- Where **things** are stored, operated, or repaired.
- Maintenance can happen directly to the **location** itself.

The Actor

- The dynamic component.
- Items of tracked economic value.
- Moves from location to location.
- Maintenance happens to the item.

Tracking Assets: The Centrifugal Pump Example

Non-Rotating Asset

Has a **Unique Asset Number ONLY**. Used for tracking unique, one-off items.

Rotating Asset

Has an **Asset Number** AND an **Inventory Item Number**.

Inventory Item # (Group Tracking)

(Individual Lifecycle Tracking)

The 6 Types of Locations

Systems: Building Location Hierarchies

Classifications: Standardizing Specifications

Action Highlight

Checking this instantly pushes the attribute to all child classifications, ensuring vendor consistency across your database and preventing duplicates.

Meters: The Vital Signs of Your Assets

Meters are virtual identifiers associated with both Assets and Locations to record operational measurements and track long-term performance.

The Administrator's Navigation Hub

Keep this architectural map handy to navigate the EMS intuitively based on data hierarchy rather than memorization.
